Stem Cells in Development and Disease

Collaborative Research Center SFB 873

The focus of SFB 873 is on the regulatory processes in self-renewal and differentiation of somatic stem cells. Our approach is to define this decision making in different organisms across the kingdoms of life ranging from Arabidopsis, Hydra, Drosophila, Medaka, Xenopus, to mice and humans. This comparative approach will provide essential knowledge on the fundamental principles behind the balance between self-renewal and differentiation in normal development and disease.
